

WSO2 MOTOR RALLY 2027

PROPOSAL FOR WSO2

WE TURN MIXED TEAMS
INTO CONNECTED
TEAMS THROUGH
EXPERIENCES THAT ARE
BALANCED, OUTCOMES
THAT ARE MEASURED
AND DELIVERED BY
RELEVANT EXPERTS

A glass bowl filled with white popcorn, drizzled with golden honey. A wooden honey dipper is resting in the bowl. The bowl sits on a light-colored, textured surface, possibly a piece of parchment paper. The background is a soft, out-of-focus teal color.

WHY POPCORN TEAMS?

WE ARE BUILT FOR MODERN MIXED TEAMS

1

From Gen Z to Boomers, from office staff to remote workers, we design sessions that speak to every personality and work style.

WE BRING THE RIGHT EXPERTS FOR THE RIGHT TEAM

2

Our programs blend training and consulting specialists, domain experts and inspirational figures, all based on your requirement.

WE BALANCE INTELLECTUAL WITH EMOTIONAL

3

Whether a team needs pure fun or deep development outcomes delivered in an engaging way, we offer the right mix of emotional and intellectual experiences.

WE MAKE YOUR MONEY MAKE SENSE

4

With pre and post program surveys, impact tracking and follow up sessions, we make sure your spend leads to real behaviour change and lasting value that you can justify.

WE OFFER AN ECOSYSTEM OF SUPPORT

5

Through our sister companies, clients can access wider skill development, corporate consulting, events and themed experiences that extend the impact of the program.

CORE EVENT

THEME

Designed around a digital architecture motif. Every vehicle represents a single isolated "**Data Packet**" and every participant stands as an individual "**Node**"

The goal is to routing efficiently from the source starting line to the final endpoint, achieving perfect system sync between local and international teams

ONE ACTIVE PHONE *POLICY*

To keep focus on the road and minimize interface issues, only **one designated mobile device** is active in each car during transit

This selected device executes all computations, sensor reads, and coordination, acting as the sole physical communications hub representing the vehicle's telemetry stream

ZERO-FACILITATOR

START

- System Initialization
 - The navigator links the vehicle ID and inputs crew profiles directly through the WSO2 application dropdown. Instant background database binding
- Geofence Validation
 - App tracks coordinates and locks interface until vehicle sits fully inside the startup grid boundary. Bypasses registration tables completely
- Automated Countdown
 - At exactly 9:00 AM, the server initiates an automated synchronization sequence. The initial cryptic route cipher displays instantly across all 150 apps

MODULAR TASKS: CORE

INPUTS

Task 1: Translation Cipher — App outputs complex local language terms explaining WSO2 systems. Team must decipher and select the exact architectural equivalent

Task 2: Signpost Arithmetic — Read public signpost digits at designated coordinate points. Solve sequential mathematical equations within the app interface

Task 3: Milestone Digit Scan — Match current path metrics with physical roadside markers. Input physical value for validation against route benchmarks

Task 4: Eco-Driving Telematics — The device accelerometer measures hard stops or high cornering spikes, computing a drive efficiency score across 10 kilometers

Task 5: Precision Radius — Automatically validates completion the second the active mobile unit crosses a specific 15-meter coordinate boundary

MODULAR TASKS: SENSOR *VERIFICATION*

Task 6: Commercial Barcode Scan — Teams stop to acquire a generic local item (e.g. local soda). Camera verifies barcode matches database payload

Task 7: Architectural Crossword — Complete a quick system integration grid on the display combining local geography and technical product parameters

Task 8: Bluetooth Proximity Ping — Vehicle passes pre-hidden BLE beacons at key paths. Sensor tracks unique UUID codes automatically

Task 9: Time-Locked Blind Count — Closes screens after 3 seconds, forcing crew to estimate exactly 45 seconds before manual ping. Evaluates precision

Task 10: Cultural Multi-Select — Unlocks short trivia on international passengers' native origins, fostering team dialogue to secure coordinates

MODULAR TASKS: ADVANCED

NAVIGATION

Task 11: Dynamic Route Selection — Choose between solving a rigorous logical puzzle or skipping for a longer alternate physical route

Task 12: Mandatory Static Rest — Enforces hydration stop. App locks into a static state for 5 minutes once inside designated rest stop geofence

Task 13: Odometer Calibration — Input initial mileage alongside checkpoint values. App algorithms contrast values against standard route distance

Task 14: Geofence Trivia — Instant popup trivia matches the vehicle's current landmark location. Closes automatically after 30 seconds

Task 15: Sequence Gate Match — Arrange visual logic gate connectors inside the app UI to replicate standard system data flows

ROUTE 1: **INLAND** ***CIRCUIT***

Path: [Start] → Parliament Road →
Maharagama → Piliyandala → Kahathuduwa
→ Bandaragama

Focus: Heavy focus on high-density roads
and suburban junction logistics. Highly
suited for landmark math questions,
signpost readings, and urban geofences

ROUTE 2: **WETLANDS** ***TRAIL***

Path: [Start] → Attidiya Wetlands →
Boralesgamuwa → Moratuwa → Bolgoda Lake →
Bandaragama

Focus: Scenic secondary roads along beautiful coastlines and winding lake segments. Optimized for BLE proximity beacon hunts, telematics tests, and nature landmarks

PEARL BAY

ARRIVAL

- Auto Logoff: Cross-referencing geofence entrance marks final time and immediately locks scoring vectors
- Live Leaderboard: Active scoring data offloads dynamically onto main pavilion projection screens instantly
- Digital Vouchers: Mobile interface automatically translates to entry codes, assigned lockers, and lunch passes

VIDEO *DEBRIEF*

The program will be followed by a Video Debrief session each day, where participants will be able to extract the full essence of their experiential learning exercise by watching videos of themselves in action!
